

PROJECT BRIEF

Participant Registration & Attendance Platform A

Student-Built Deliverable, Delivered Under Direct Instructor Oversight

Purpose & Concept

Uncommon.org will design and build the registration, attendance, programme, and partner-directory platform for the OAK Zimbabwe Partner Gathering as a live student project inside our Tech Bootcamp. Students from the Software Engineering and Product Design tracks will own the build end-to-end from wireframe to deployment while Uncommon instructors supervise, review, and sign off on every stage.

This is a deliberate choice, not a cost-cutting shortcut. It turns the platform into a visible demonstration of what Oak Zimbabwe's grant funding has produced at Uncommon: the same students Oak's support has helped train will build the tool that partners use at Oak's own event. Staff supervision applies throughout, so student authorship does not lower the bar on reliability.

Objectives

- Give the coordination team a live, accurate daily headcount via QR check-in no manual sign-in sheet.
- Capture dietary, accessibility, and travel needs at registration so accommodations are arranged in advance.
- Give every partner a single mobile-friendly home for the agenda, daily documentation posts, and the partner directory.
- Deliver a lean, reliable tool within a realistic build window, not a full custom system, while still giving Bootcamp students a real, funder-visible portfolio project.

Scope

Core Screens

- **Registration:**
 - Online form capturing attendee name, organization/sub-partner, role, contact details, dietary and accessibility requirements, and travel needs. Each

submission generates a unique QR code tied to that attendee.

- **Attendance / Check-in:**

- Attendees and Oak staff scan their personal QR code at check-in points with any smartphone camera no dedicated scanning hardware.

Uncommon.org

Education | Technology | Purpose

- **Programme page:**

- Mobile-friendly day-by-day schedule with session times and locations, plus the daily documentation post (notes + curated photos).

- **Partner directory:**

- Lists all partner organizations and sub-partners attending, with logos and website links, the same links used to generate nametag QR codes.

Out of Scope

- No user accounts or login system attendees are identified by their unique QR code.
- No native mobile app, a mobile-responsive web page accessed via link or QR code.
- No payment processing or complex workflow logic.

This scope keeps the build achievable within 3–4 weeks for a small student team, with time remaining for end-to-end testing before registration opens.

Team & Governance

Role	Who	Responsibility
Student developers	Tech Bootcamp: Software Engineering track	Build registration, check-in, and programme logic on the no-code platform
Student designers	Tech Bootcamp: Product Design track	Wireframes, nametag layout, mobile UX, partner directory design
Department Heads	Beyond & Elisha	Direct supervision, code review at every stage, and final sign-off before each milestone ships

Staff supervision and sign-off apply to every stage of the build, so student authorship does not lower the bar on reliability

Data Handling

The platform will hold personal and organizational data for 110 people. We will include a short consent statement at the point of registration explaining what data is collected and how it will be used, and the underlying data list will be held securely and shared only with Oak Zimbabwe and the coordination team, not published or reused beyond this event.

Uncommon.org

Education | Technology | Purpose

Data Handling

- All 110 attendees registered with a working personal QR code ahead of 9 November.
- Daily check-in gives the coordination team an accurate live headcount without a manual register.
- Programme page and partner directory load reliably on attendee smartphones with no login required.
- Every build stage is reviewed and signed off by an instructor before moving to the next stage.
- Platform stands as a funder-visible example of Tech Bootcamp students' work for Oak Zimbabwe
